Clay mineral facial scrubs and masks with
astaxanthin and zeolite

Origin: 12 million years ago, in the south-western parts of the Tokaj Mountains', geological conditions were similar to those of present New Zealand or the Indonesian Archipelago. Volcanic cones were spewing ash, mud and lava upon their slopes and into the shallow waters of the surrounding bays or the lakes of thermal springs. According to Greek philosophy, the four primordial elements - fire (volcanos), water (shallow bays and lake system), air (volcanic gases), and earth (volcanic lava and tuff) met here.

This meeting imitated the origins of life in a smaller scale. Even if not primordial but organic material was made here; minerals, which play an important role not only in the origins of life but also in its sustenance. The bioelements brought to the surface by the volcanic elevator from a depth of 15-25 km from the depths of the earth's crust are attached to their structure in a mobile and soluble way. The raw material of the Mask consists of the ancient hydrothermal volcanic sludge described above.

Indications: Regular application to inflamed, acne-prone, seborrheic facial skin during puberty can achieve a significant reduction in inflammation. After application, sebum production decreases significantly. With regular treatment, approx. 34% persistent sebaceous depression is expected. Excellent for isolated drying of acne lumps. By removing the keratinized upper epithelial cells of the skin surface, a smooth, aesthetic skin surface is obtained.

Mechanism of action: Using Mask cream removes the keratinized upper layer of the skin surface and fat deposits (peeling). As a result, the skin becomes open to the active ingredients of the cosmetics to be applied to the skin, and iontophoresis or hydration takes place quickly and easily. After removing the semi-dried or completely dried cream (exfoliation or washing), the skin is velvety smooth, cool to the touch, but at the same time, has a pleasant, warm feeling. It is recommended to use a vitamin moisturizer after the treatment.

Methods of application:

- As a face mask: Apply the cream to a thickness of 1 mm and leave it on the face until it forms a white, dry, slightly cracked layer (25-30 minutes). The resulting mineral mask is to be washed off with lukewarm or cold water and cotton wool. If necessary, post-treat with a moisturizer. Highly recommended for oily skin, can be applied daily. Recommended for normal skin as an exfoliating agent once a week.
- As a facial scrub: Apply a thin layer of the Mask, which is pressed from the tube onto the fingertip, then on the face to be treated. After waiting 1-2 minutes, when it's almost dry, rub it off with your fingertips with massaging movements. Abrasion is optimal when the material peels off like eraser. If necessary, post-treat with a moisturizer. In this form, it is recommended to use 3-4 times a month
