Origin: 12 million years ago, in the south-western parts of the Tokaj Mountains', geological conditions were similar to those of present New Zealand or the Indonesian Archipelago. Volcanic cones were spewing ash, mud and lava upon their slopes and into the shallow waters of the surrounding bays or the lakes of thermal springs. According to Greek philosophy, the four primordial elements - fire (volcanos), water (shallow bays and lake system), air (volcanic gases), and earth (volcanic lava and tuff) met here.

This meeting imitated the origins of life in a smaller scale. Even if not primordial but organic material was made here; minerals, which play an important role not only in the origins of life but also in its sustenance. The bio-elements brought to the surface by the volcanic elevator from a depth of 15-25 km from the depths of the earth's crust are attached to their structure in a mobile and soluble way.

Body scrub family with zeolite, clay mineral and amino acid

The raw material for Slightly is zeolite rhyolite tuff, which is ancient, hydrothermal volcanic mud as well as an acidic volcanic explosion product.

Mechanism of action:

Prolonged and excessive use of most shower gels on the market can cause the stratum corneum to thicken, which can also be a cause of increasing hair follicle inflammation.

Regular use of the body scrub can prevent thickening of the stratum corneum. The individual components of the skin scrub have a positive effect on the human body, both individually and additionally.

Body scrub family with zeolite, clay mineral and amino acid

1. The mineral components adsorb fats, oils, sebum particularly well and adhere well to semi-detached epithelial cells. Rubbing the body part to be treated results in cleansing the skin and cleansing the pores.

2. Rubbing and massaging the skin surface removes the dead epidermis and causes increased local blood flow in the subcutaneous parts. It also helps to refresh the deeper levels of the skin.

3. Trace elements enter the dermal part by infiltration straight from the clay mineral-containing skin scrub applied to the skin surface.

• How to use:

• Apply the clay mineral granular paste to the moisturized skin surface at least 1 mm thick and thoroughly but gently cleanse and massage the body.

• Leave it on the skin for 2-3 minutes, while the cleansed surface will absorb the active ingredients of the eraser.

• After using the eraser, the skin breathes freely again and regenerates. Every skin is different, so you will feel whether you should use it once or twice a week.
